Please enter the following claims:

A'SIM

- A process for preparing an aqueous dispersion of latex particles having a heterogeneous morphology by a semicontinuous emulsion polymerization comprising:
- a) folyming a surfactant, or protective colloid; and
- b) forming an emulsion polymer by a semicontinuous process from a monomer mixture, using said surfactant, or protective colloid, wherein said monomer mixture comprises:
 - 1) 10 to 70 percent by weight of at least one nonionic, ethylenically unsaturated monomer having a Tg above 30°C; and
 - 2) 5 to 30 percent by weight of at least one hydrophillic, ethylenically unsaturated monomer.
- 31. The process of claim 30 further comprising forming said emulsion polymer in the presence of an in situ seed polymer.
- 32. The process of claim 31 wherein said seed polymer comprises from 0.01 to 25 percent by weight of said emulsion polymer.
- 33. The process of claim 30 wherein said protective colloid is a (co)polymer stabilizer having cationic functionality.
- 34. The process of claim 33 wherein said cationic functionality comprises a quaternary ammonium group.
- 35. The process of claim 33 wherein said cationic (co)polymer stabilizer is formed in an aqueous medium to which the monomer mixture is subsequently polymerized.
- 36. The process of claim 30 wherein said monomer mixture further comprises an anionic functional monomer.
- 37. The process of claim wherein said monomer mixture comprises at least one monomer having at least one protonated reactive group, which is capable of becoming deprotonated by raising the pH-value of the aqueous dispersion.
- 38. The process of claim 30 wherein said nonionic, ethylenically unsaturated monomer has a Tg of from 50°C to 1 10°C.

- The process of claim 30 wherein said nonionic, ethylenically unsaturated monomer is styrene or a styrene derivative.
- 40. The process of claim 30 wherein said hydrophillic, ethylenically unsaturated monomer comprises at least one acid functional monomer.
- 41. The process of claim 40 wherein said acid functional monomer is an acrylic of methacrylic acid.
- 42. The process of claim 40 wherein the ratio of said acid functional monomer to the other monomers in the emulsion polymer is about 1:70.
- 43. The process of claim 30 wherein said latex particles are monodisperse and have an average diameter of from 30 to 1000 nm.
- 44. An aqueous dispersion of latex particles formed by the process of claim 30.
- 45. The aqueous dispersion of claim 44 comprising a mixture of the latex particles formed by the process of claim 30 with at least one dispersion containing other latex particles.
- 46. Latex particles formed by the process of claim 30 which have been dried by the removal of water from the aqueous dispersion.
- 47. The latex particles of claim 46 wherein said particles have a heterogeneous morphology having a hydrophilic inner phase and a hydrophobic outer phase.
- 48. The latex particles of claim 46 wherein said hydrophilic phase is alkalisoluble.
- 49. The latex particles of claim 46 wherein said particles are redispersible in an aqueous medium.
- 50. The use of the latex particles of claim 46 in composite and coating mortars, cement dyes, adhesives, plastics cement-bound systems, cement-free binders, wallpaper pastes and glass fiber composite systems.

REMARKS

Claims 1-29 were originally filed in PCT/EP 99/05205. Claims 1-29have been canceled and claims 30 to 50 added. Support for the new claims is found
